removing faults

Faults	Reasons	Ways
Air temperature	Pressure of steam reducing.	Restore the normal pressure, check the steaming system.
drops.	Too much condensate water.	Check and replace the exhausting devices. Check and repair heat preserving walls of steaming pipes.
	Too much supply of fresh air.	Check valves of heat preserving devices. Adjust the valves of exhausting system.
	False running of heating fans, or heat preserving walls being worn.	Adjust heating fans. Mend heat preserving walls.
	Heat conduction of heater reducing.	Clear heater off dirt and scraping.
Jetting speed	Unusual running of heating fans.	Adjust heating fans.
lowers.	Jam of scraping in heater.	Clear off scraping.
	Too much scraping in jetting bellow.	Clear off scraping.
Moisture of air	Air temperature dropping.	Check steaming system.
is too high in	Leak of steaming system.	Mend the leak.
humidity.	Too low air current.	Check heating fans.
	Faults in exhausting system.	Check and repair.
Efficiency drops	Wrong rotating direction of heating fans.	Correct the rotating direction.
suddenly.	Too loose belts.	Tighten them.
	Leak of steaming system.	Mend the leak.
	Jam of exhausting system.	Clear filter of exhausting system off dirt.
	Too high the opposite pressure in exhausting	Reduce the oppsite pressure
	system.	below 1×10 ⁵ Pa.
	Invalidation of engines of heating fans.	Change engines.
	Invalidation of air-driven valves	Replace them.
	Steam pressure reducing, then temperature	Increasing stem pressure to
	reducing.	standard.
Veneer cools	Wrong rotating direction of fans.	Change the rotating diretion.
not enough.	Wrong adjustment of valves.	Readjust.
