## High precision screw

### ■ Numbering rules and meanings

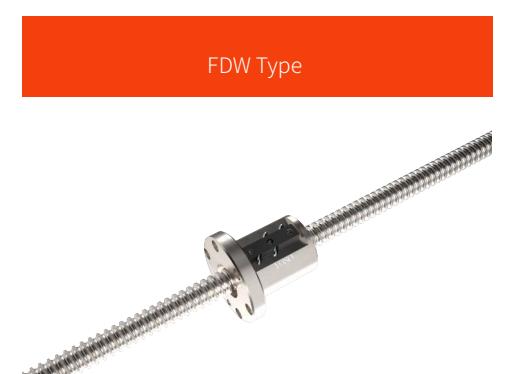

#### Numbering rules of ball screw

FSDC 3205 - 3 RR G0 + 1500L C3

### ■ Structure type of ball screw

YOSO precision ball screw is standardized into 6 nut types shown in the figure. In addition, in order to meet the requirements of customers, we can produce non-standard nuts with special shapes (such as square, axis intersection, etc.), special properties (such as high temperature resistance, corrosion resistance, etc.) and super specifications (such as extension and heavy load). If there is any need, please contact us.

## High precision screw

### ■ Lead accuracy of ball screw

#### Accuracy class:

According to the scope of use and requirements, the ball screw is divided into two types: positioning ball screw (P) and driving ball screw (T). The accuracy level is mainly divided into seven levels, i.e. level 1.2.3.4.5.7.10.

Level 1 accuracy is the highest and gradually decreases

Lead accuracy of ball screw

Stroke deviation and variation (see figure-1 and table-2)

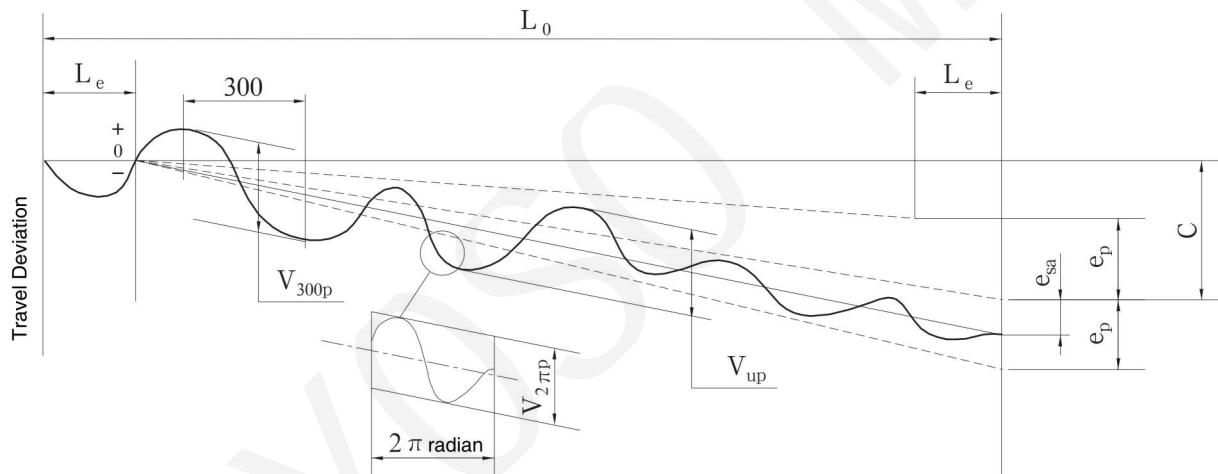

Figure-1

Table-2 stroke deviation and variation (from GB / t17587.3)

Project No.	Inspection contents	Symbol	Effective travel (mm)	Accuracy class							
				1	2	3	4	5	7	10	
1	Stroke variation in any 300 stroke	V <sub>300p</sub>	—	6	8	12	16	23	52	210	
2	2π rati	V <sub>2\pi p</sub>	本项仅适用于P类	4	5	6	7	8	—	—	
				≤315	6	8	12	16	23	—	—
				>315~400	7	9	13	18	25	—	—
				>400~500	8	10	15	20	27	—	—
				>500~630	9	11	16	22	32	—	—
				>630~800	10	13	18	25	36	—	—
				>800~1000	11	15	21	29	40	—	—
				>1000~1250	13	18	24	34	47	—	—
				>1250~1600	15	21	29	40	55	—	—
				>1600~2000	18	25	35	48	65	—	—
				>2000~2500	22	30	41	57	78	—	—
				>2500~3150	26	36	50	69	96	—	—
				>3150~4000	32	45	62	86	115	—	—
				>4000~5000	—	—	76	110	140	—	—
				>5000~6300	—	—	—	—	170	—	—
3	Average travel deviation within effective travel L (this item is only applicable to class P ball screw)	e_p	$e_p = \frac{2L}{300} V_{300p}$	Note:1)stroke compensation value C=0      2)Vopsee item No.1 in this table							

Note:if the thread length of ball screw exceeds 6300mm,please consult with our company

Note:1)stroke compensation value C=0      2)Vopsee item No.1 in this table

Project No.	Inspection contents	Symbol	Effective travel (mm)	Accuracy class							
				1	2	3	4	5	7	10	
4	Stroke variation within the effective stroke L <sub>u</sub> (this item is only applicable to class P ball screw)	V <sub>up</sub>	Note1:the effective stroke Lu of the T-type ball screw rod (internal stroke variation)is generally not checked Note2:if the thread length of ball screw exceeds 6300mm,please consult with our company	≤315	6	8	12	16	23	—	—
				>315~400	6	9	12	18	25	—	—
				400~500	7	9	13	19	26	—	—
				500~630	7	10	14	20	29	—	—
				>630~800	8	11	16	22	31	—	—
				>800~1000	9	12	17	24	34	—	—
				>1000~1250	10	14	19	27	39	—	—
				>1250~1600	11	16	22	31	44	—	—
				>1600~2000	13	18	25	36	51	—	—
				>2000~2500	15	21	29	41	59	—	—
				>2500~3150	17	24	34	49	69	—	—
				>3150~4000	21	29	41	58	82	—	—
				>4000~5000	—	—	49	70	99	—	—
				>5000~6300	—	—	—	—	119	—	—

The effective travel L<sub>u</sub> is calculated as follows:

$$L_u = L_1 - 2L_e$$

Where: L<sub>u</sub> — effective stroke, mm

L<sub>1</sub> — total length of screw thread, mm

L<sub>e</sub> — excess distance, mm (see table-3)

Table-3

Nominal lead P <sub>h0</sub>	2.5 ≤ P <sub>h0</sub> ≤ 12	12 ≤ P <sub>h0</sub> ≤ 40	40
Remaining distance L <sub>e</sub>	4P <sub>h0</sub>	3P <sub>h0</sub>	2.5P <sub>h0</sub>

### ■ Shape and position tolerance of mounting datum plane of ball screw (See figure-2 and table-4)

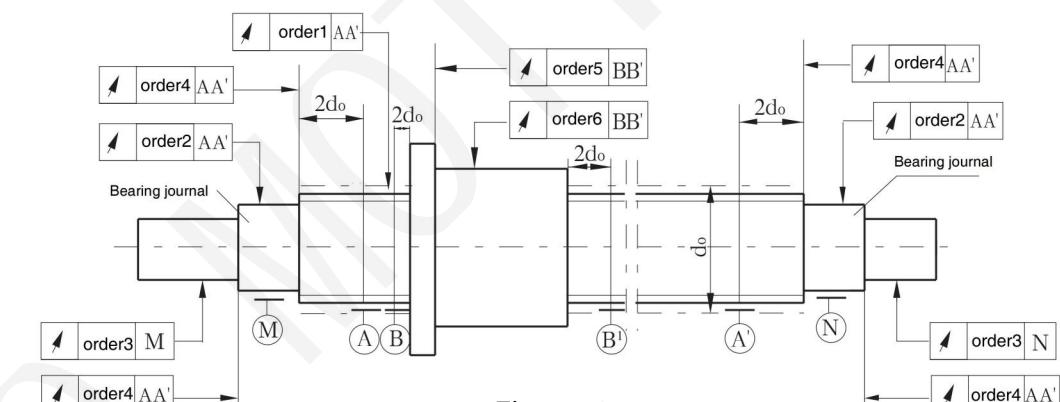

Figure-2

## High precision screw

### ■ Applicable accuracy grade of various machines

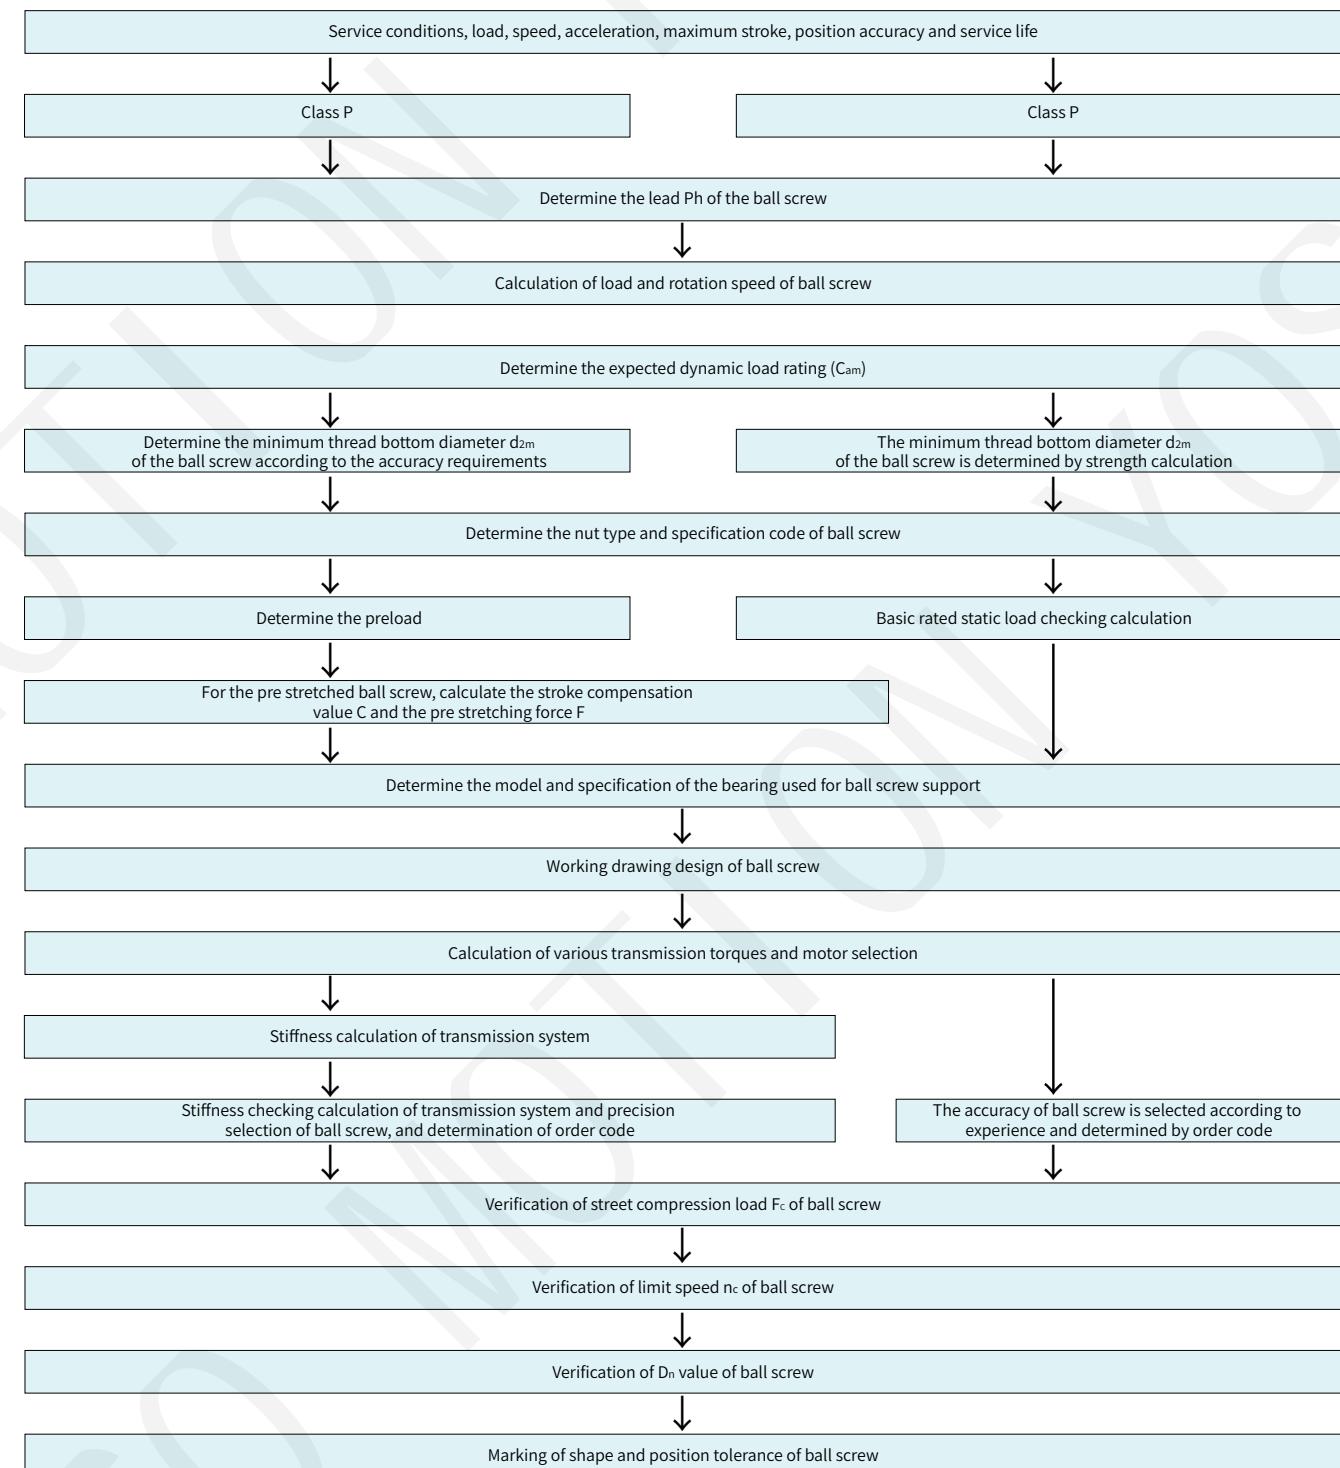

The following table is an example of selecting accuracy levels according to different uses according to the actual experience of Jingpeng Machinery & Equipment (Shanghai) Co., Ltd. ○ the mark indicates the range of accuracy level used more. Through this table, the accuracy grade of the ball screw can be preliminarily selected. In addition, the accuracy grade of the ball screw with the positioning accuracy that meets the actual requirements can be confirmed by the list of "stroke deviation and variation" (table-2 on page P03).

### ■ Parameter calculation and selection of ball screw

Calculation steps and processes

## High precision screw

### FSDC compact high speed precision ball screw

Note:

- (1)  $K_c$  is the theoretical calculation value when the preload  $FP$  is  $0.1C_a$  and the axial load  $F$  is  $0.3C_a$ ;
- (2) When the axial load  $F$  is not equal to  $0.3C_a$

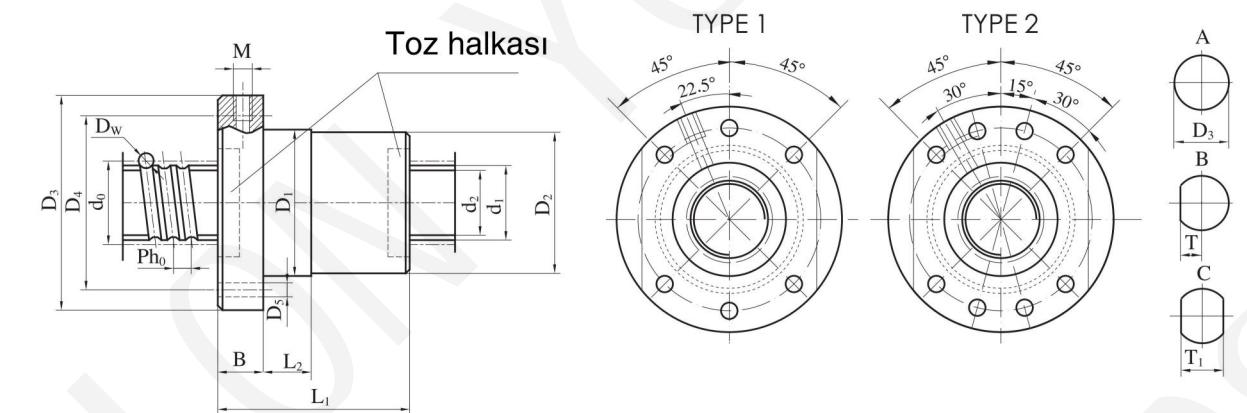

$$K'_c = K_c \left( \frac{F}{0.3C_a} \right)^{\frac{1}{3}}$$

Where:

$K_c$  is the stiffness value in the table;

- (3) This type of ball screw is suitable for high-speed applications;
- (4) Normal working environment temperature range  $\pm 80^\circ\text{C}$ ;
- (5) Special requirements shall be put forward when ordering.

Specification code	Nominal diameter	Nominal lead	Outer diameter of screw	Bottom diameter of screw	Steel ball diameter	Number of cycles	Basic rated load		Rigidity $K_c$ N/ $\mu\text{m}$

## High precision screw

### FDDC Compact high speed precision ball screw

Note:

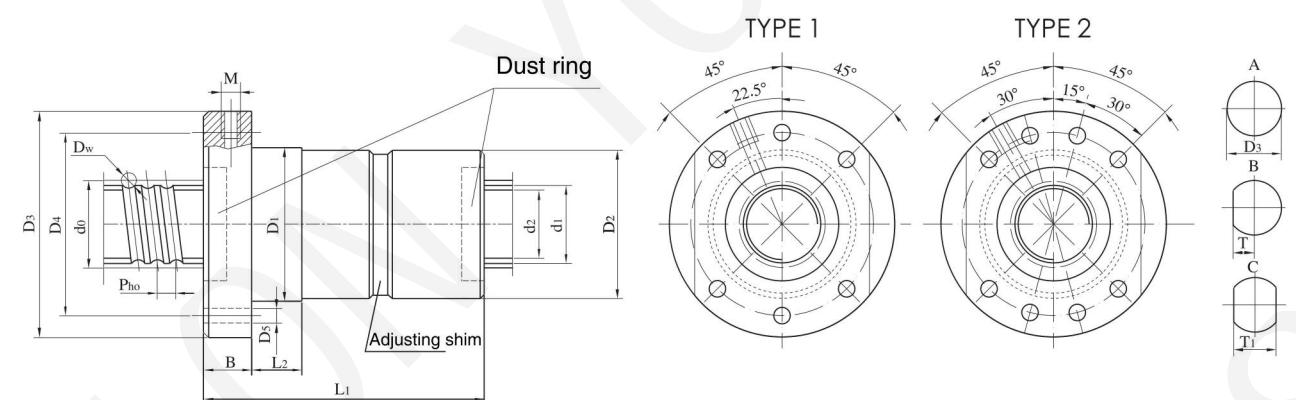

- (1) KC is the theoretical calculation value when the preload FP is 0.1Ca; and the axial load F is 0.3Ca;
- (2) When the axial load F is not equal to 0.3 Ca

$$K'_c = K_c \left( \frac{F}{0.3C_a} \right)^{\frac{1}{3}}$$

Where:

- KC is the stiffness value in the table;
- (3) This type of ball screw is suitable for high-speed applications;
  - (4) Normal working environment temperature range  $\pm 80^\circ\text{C}$ ;
  - (5) Special requirements shall be put forward when ordering.

## High precision screw

### ■ FSVC/FDVC heavy duty ball screw

#### Product application range

Large and heavy-duty CNC lathes, CNC boring machines, CNC milling machines, large steel smelting equipment, jacks, spinning machines and other mechanical equipment

#### Introduction to product design, manufacturing and testing technology

Length and heavy load have always been important problems to be overcome in manufacturing large heavy-duty ball screws. This series of products have overcome the technologies of design, heat treatment, alignment, raceway forming and dynamic detection. In terms of structural design, the product adopts a design structure with multi-path large-diameter ball circulation circuit. The maximum rated dynamic load of the product is 126 tons and the maximum rated static load is 595 tons. Jingpeng machinery has put into use a series of equipment, such as a 10m large lathe, a 10m hard body rotary milling machine, a 10m large grinder, a 10m medium frequency quenching machine, a 10m large straightening machine, a 10m laser screw stroke error measuring instrument, and has taken the lead in establishing the first single 10m ball screw production line in China.

#### Numbering rules and meanings

FSVC 8020 - 3 RR G0 + 3000L C3

Accuracy  
of ball screw

Length of ball screw

Precompression

Seal up

Number of cycles

Nut series and circulation mode

## High precision screw

### ■ FSVC heavy duty ball screw

Note:

(1)KC is the theoretical calculation value when the preload FP is 0.1Ca

and the axial load F is 0.3Ca;

(2)When the axial load F is not equal to 0.3 Ca,

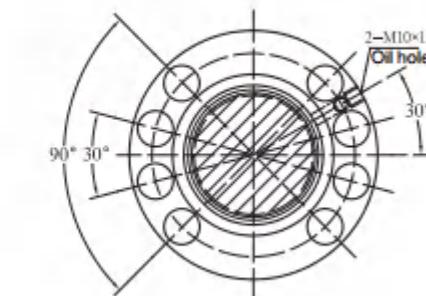

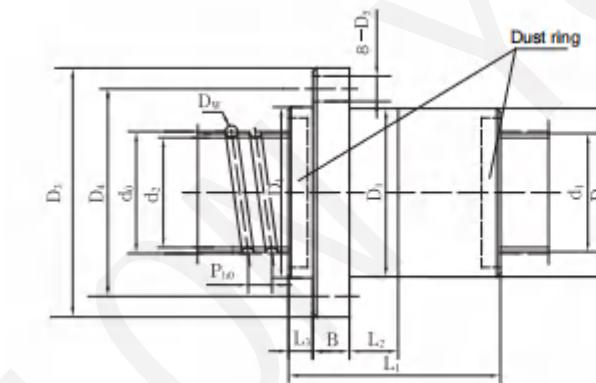

$$K'_c = K_c \left( \frac{F}{0.3C_a} \right)^{\frac{1}{3}}$$

Where:

KC is the stiffness value in the table;

(3)This type of ball screw is suitable for use under high temperature conditions;

(4)Special requirements shall be put forward when ordering.

## High precision screw

### ■ FDVC large heavy-duty gasket preloaded ball screw

Note:

(1)  $K_c$  is the theoretical calculation value when the preload  $F_P$  is  $0.1C_a$  and the axial load  $F$  is  $0.3C_a$ ;

(2) When the axial load  $F$  is not equal to  $0.3 C_a$ ,

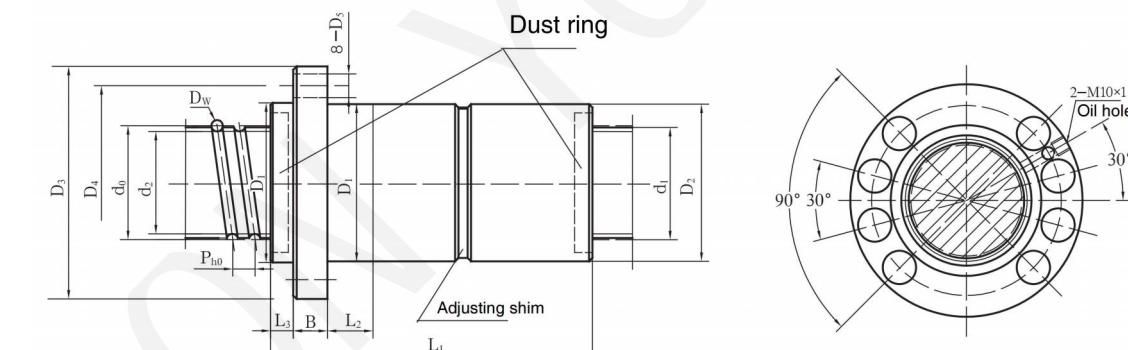

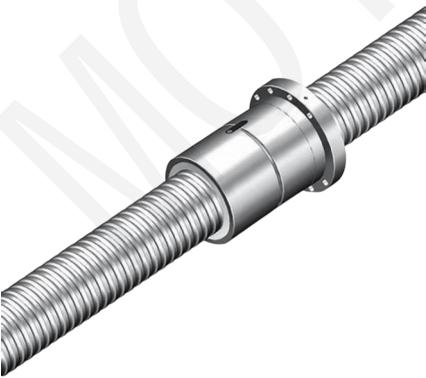

$$K'_c = K_c \left( \frac{F}{0.3C_a} \right)^{\frac{1}{3}}$$

Where:

$K_c$  is the stiffness value in the table;

(3) This type of ball screw is suitable for use under high temperature conditions;

(4) Special requirements shall be put forward when ordering.

## High precision screw

### ■ Swivel nut assembly unit

The rotating nut assembly unit is a transmission system that converts the rotating motion of the ball nut into the linear motion of the nut itself (or the ball screw). It is an extension of the ball screw. Its main components are composed of the ball screw pair, the rolling bearing pair, the nut seat, the pre tightening adjustment (locking) device, the dust-proof device and the lubricating oil circuit. The installation structure is as follows:

### 1. Characteristics of rotating nut combination unit

- Inertia is low. Taking nut rotation as the active drive greatly reduces the moment of inertia of the mechanical motion system, improves the limit speed of the system, facilitates high-speed transmission, and makes the selected motor power smaller than taking screw rotation as the active drive.
- High rigidity. The size of the bearing arranged on the outer circle of the nut is larger than that of the way in which the screw rod rotates as the active drive; At the same time, since the screw rod does not rotate, there is no need to install a bearing on its journal, which can exert a greater axial pretension force on the screw rod, so that the rigidity of the whole set of ball screw rod can be greatly improved.
- Multi nut drive. Multiple rotating nut combination units can be installed on one ball screw. Multiple worktables are driven simultaneously or separately, and their movements do not interfere with each other.
- Simple design and installation. The rotary nut combination unit integrates multiple functional components, simplifies the design and facilitates installation and commissioning.
- Other. Since the screw rod does not rotate, there is no circumferential friction at the middle auxiliary support, and there is no local heating problem; When the positioning accuracy is very high and the hollow cooling structure of the screw rod is adopted considering the influence of temperature rise, it is easier to cool the pipe joint because the screw rod does not rotate

#### Hot tip

- It is suggested that when the length diameter ratio of the screw rod is  $\geq 80$  and the depth is even  $\geq 60$ , several radial auxiliary supports should be set in the middle of the screw rod.
- In addition to the necessary installation interface dimensions of the rotating nut assembly unit, the sample also provides "recommended type dimensions of screw shaft journal" and "recommended type dimensions of synchronous belt pulley (gear)" for the convenience of design for the reference of the main engine designer.
- The standard series products of our company are given in the sample. If the standard series products can not meet the needs, please contact our company for special orders.

### 2. Accuracy of rotating nut assembly unit

Refer to the standard GB /T17587.3 for ball screw

### 3. Pre tightening of rotating nut assembly unit

This sample introduces two structural types: light load and heavy load. The light-duty rotary nut assembly unit is generally not pre tightened and is used as a transmission device. The heavy-duty rotary nut combination unit adopts gasket pre tightening, which is generally pre tightened according to 5% of the rated dynamic load of the model before delivery

### 4. Lubrication of rotating nut assembly unit

The nut seat is equipped with a standard metric lubrication interface. According to the working conditions, centralized lubrication at the gas station or manual oil injection lubrication can be adopted. Two oil paths, one for rolling bearing lubrication and the other for ball nut lubrication.

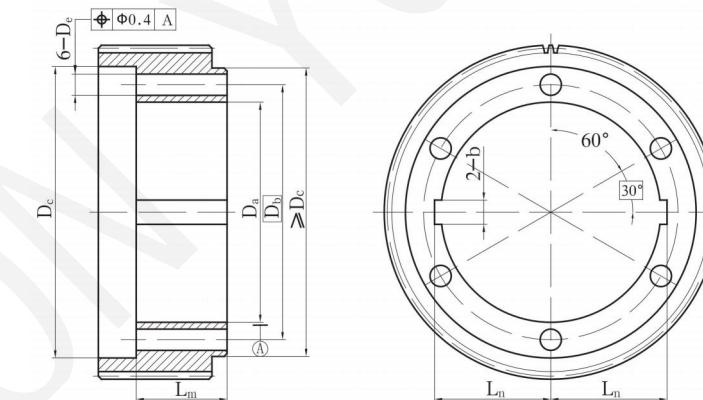

### 5. Dust prevention of rotating nut assembly unit

The combination unit has been equipped with conventional dust-proof devices for the ball screws and ball bearings. It is recommended to install other dust-proof (cover, sleeve) devices on the workbench, which is more conducive to reducing wear and prolonging service life.

### 6. Numbering rules and meanings

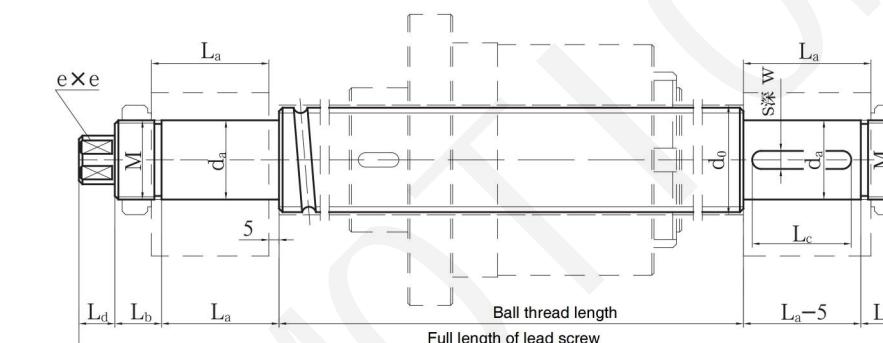

YS-BLR 1616 - S3 - 2 RR G0 + 1200L C3	Accuracy of ball screw
	Length of ball screw

## External circulation large load screw

■ FDW、FDDW model

### 1. Structure and specialties

Unprocessed products at the end of the shaft are produced by standardizing the screw shaft of precision ball screws and processing it into a series of mass-produced products of specified length. The screw shaft end is easy to be machined.

In addition, there are single nut FDW type and double nut FDDW type nut models. Please choose the appropriate type according to the purpose of use.

### 2. dustproof

When dirt or other foreign objects may enter the ball screw, a dust-proof device (such as a telescopic cover, etc.) must be used to completely cover the screw shaft.

### 3. lubrication

For nuts, lithium soap based lubricating oil has been sealed at the time of delivery.

### 4. Additional processing of the screw shaft end

Due to the fact that only the effective threaded portion of the screw shaft is surface hardened through induction hardening or carburizing treatment, it is very easy to perform additional machining on the shaft end through a grinder or milling machine.

In addition, as both ends of the screw shaft have central holes, they can accept external cylindrical grinding processing.

Surface hardness of effective threads : 58 to 64HRC

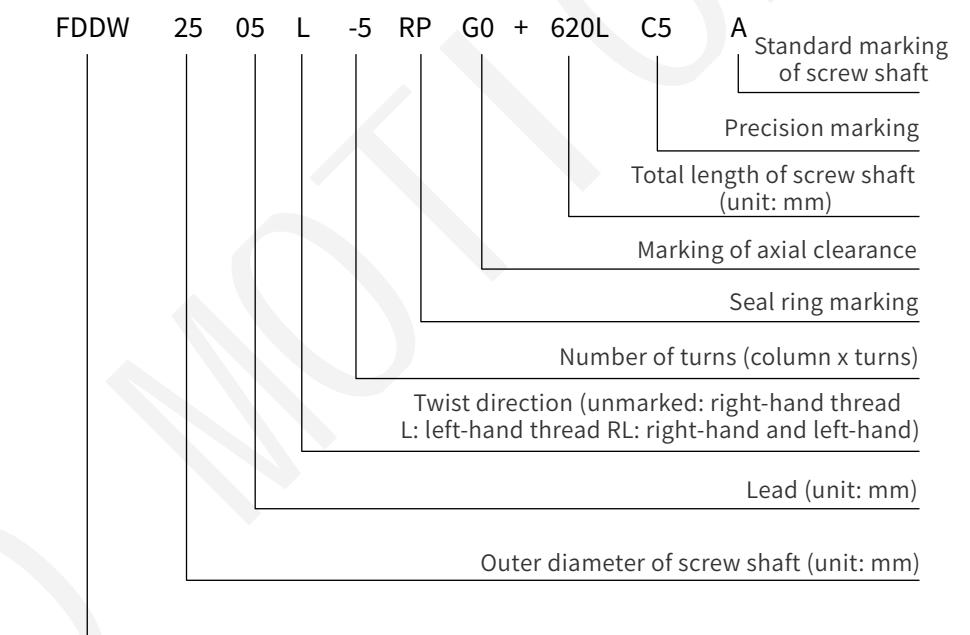

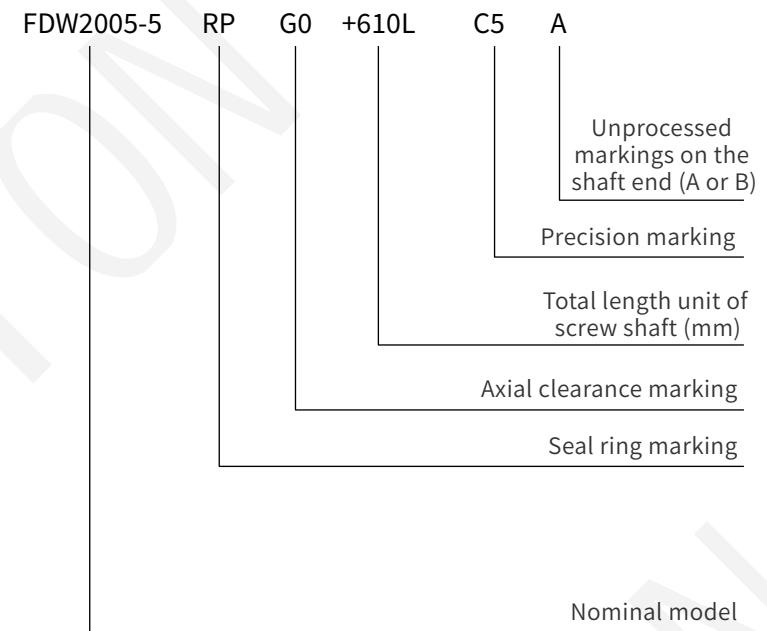

Surface hardness of the end of the screw shaft : 22 to 27HRC

### Tips:

We have standardized the shape of the screw shaft end for quick estimation and manufacturing of ball screws.

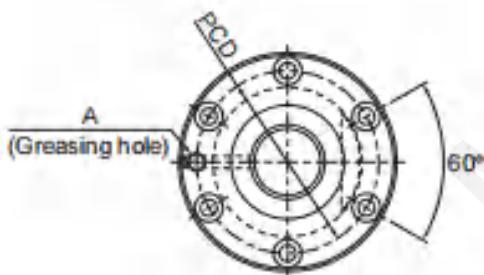

■ The numbering rules and meanings of high load screws in the outer loop

## HTF-SRC series Heavy duty ball screw

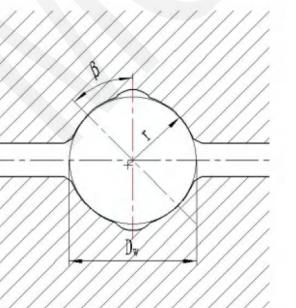

### ■ IF Heavy-Duty Ball Screw Introduction

#### Heavy load

YOSO optimizes the contact angle and raceway arc of the steel ball to achieve higher load-bearing capacity for the ball screw.

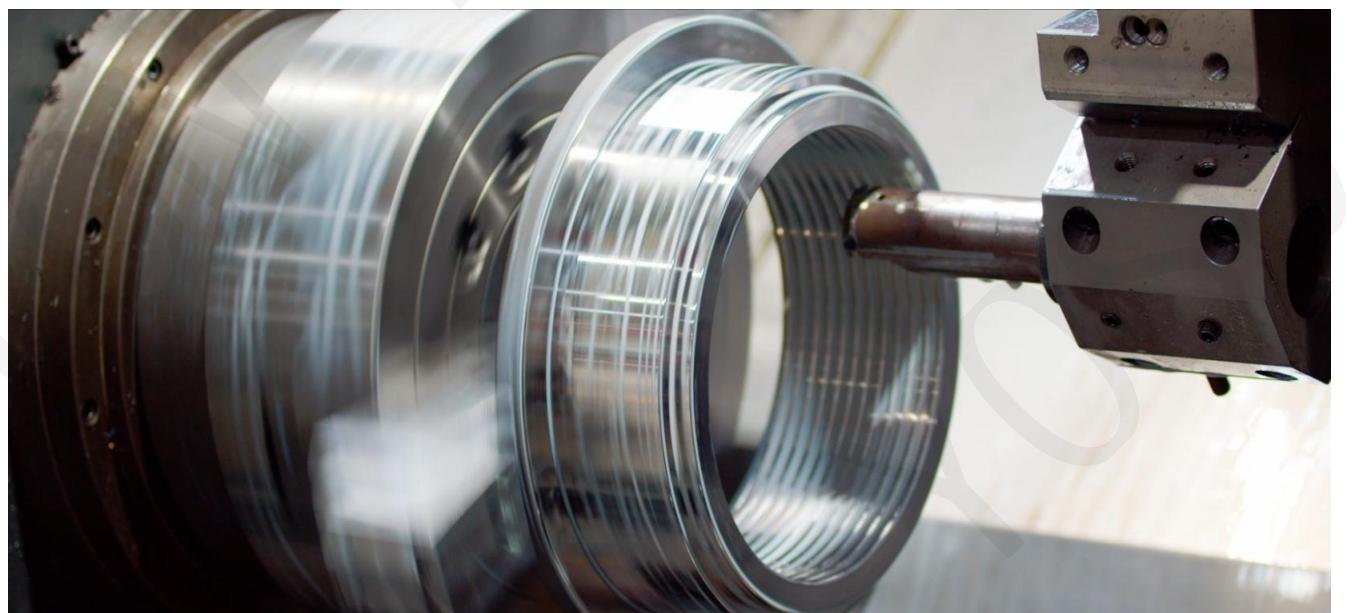

YOSO heavy-duty ball screw pair groove shape

$\beta$  contact angle r raceway radius Dw ball diameter

#### High speed, low noise

By optimizing the steel ball circulation path, the YOSO HTF-SRC series heavy-duty ball screw pair has an difficult to imitate steel ball circulation path, where the steel ball travels Smooth and smooth operation, higher DN value and lower noise.

### ■ New Generation Products

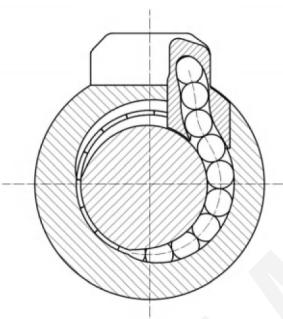

Previous generation SRC steel ball circulation system product

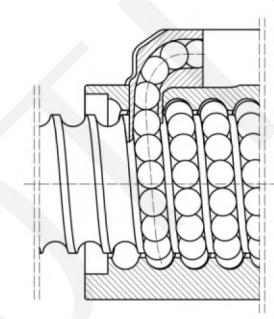

New generation SRCS steel ball circulation system product

The YOSO HTF-SRC series heavy-duty ball screw pair has been fully upgraded, and the upgraded high-speed heavy-duty ball screw pair adopts the SRCS integrated steel ball circulation system. The transmission speed of the previous generation SRC steel ball circulation system has been greatly improved. The maximum DN value of the SRC steel ball circulation system transmission is 100000, and the SRCS integrated steel ball circulation system The DN value is as high as 150000, and the noise level has significantly decreased. The SRC steel ball circulation system is composed of multiple components, while the SRCS steel ball circulation system uses a single body Design and manufacture with a steel ball circulation path that is difficult to imitate, integrating multiple components of the previous generation SRC steel ball circulation system into one part. The SRCS steel ball circulation system can accommodate more load-bearing cycles, with a load-bearing capacity 1.5 times that of the SRC steel ball circulation system, and a heavier weight compared to the previous generation SRC steel ball circulation system. It is lighter and has a simpler appearance.

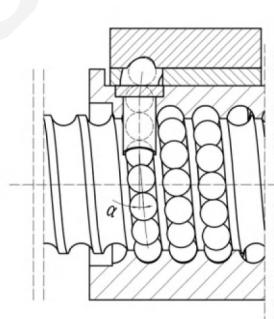

### ■ Optimize The Running Path Of Steel Ball

SRCS cycle and SRC cycle circumferential path diagram

SRCS cyclic spiral radial path diagram

SRC cyclic spiral radial path diagram

The running paths of SRCS and SRC in the circumferential direction of the steel ball are consistent, both smoothly turning along the centerline direction; The difference between SRCS and SRC is that SRCS smoothly rises in the spiral direction along the spiral ascending direction, while SRC rises vertically, forming a turning angle  $\alpha$ , so SRCS runs faster and produces less noise than SRC.

YOSO keeps up with the pace of the times and helps equipment manufacturing develop rapidly towards high speed, automation, and intelligence. We have developed various specialized YOSO heavy-duty ball screw by-products for fully electric high-speed servo injection molding machines, servo compression machines, high-precision servo powder forming machines, heavy-duty servo electric cylinders, and other similar products. Currently, a single set of YOSO ball screw pairs has a full coverage of pushing force of 1-200 tons, while multiple sets use up to 1000 tons.

## HTF-SRC series Heavy duty ball screw-Specialized for injection molding machine industry

■ External circulation large load screw

**01**

High speed all electric servo injection molding machine

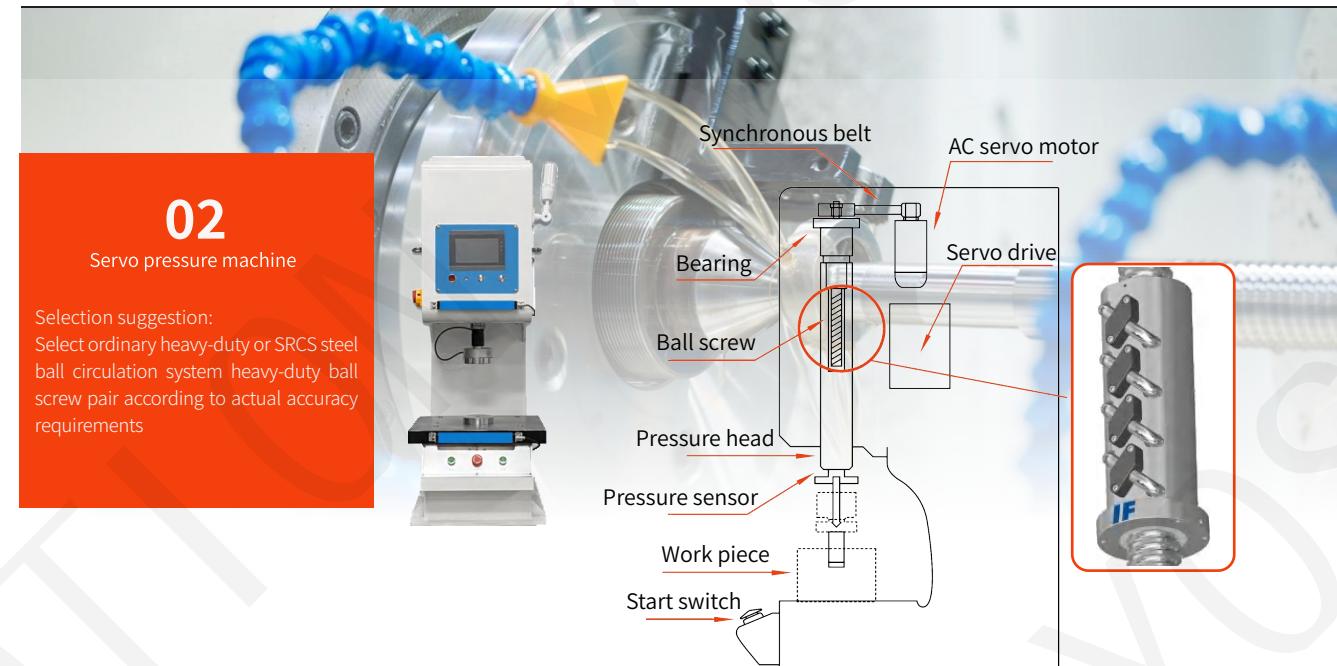

Selection suggestion:  
It is recommended to choose SRCS steel ball circulation system ball screw pairs for injection molding spindles, while ordinary ball screw pairs can be selected for other axes

**02**

Servo pressure machine

Selection suggestion:  
Select ordinary heavy-duty or SRCS steel ball circulation system heavy-duty ball screw pair according to actual accuracy requirements

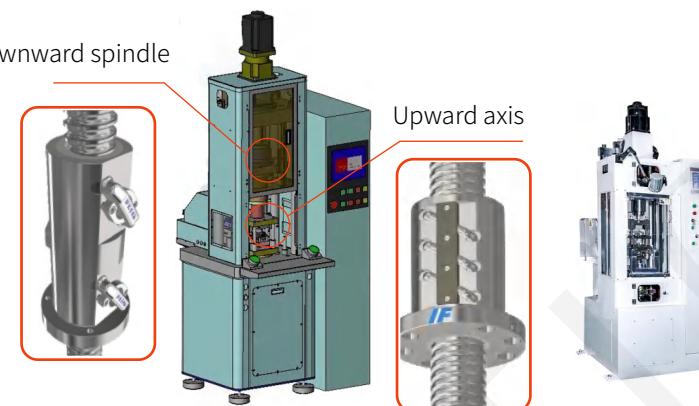

**02**

Servo pressure machine

Selection suggestion:  
Select ordinary heavy-duty or SRCS steel ball circulation system heavy-duty ball screw pair according to actual accuracy requirements

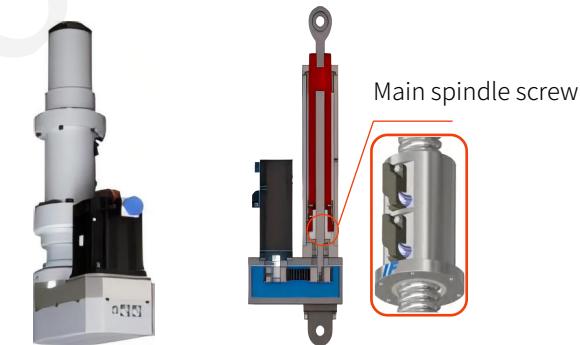

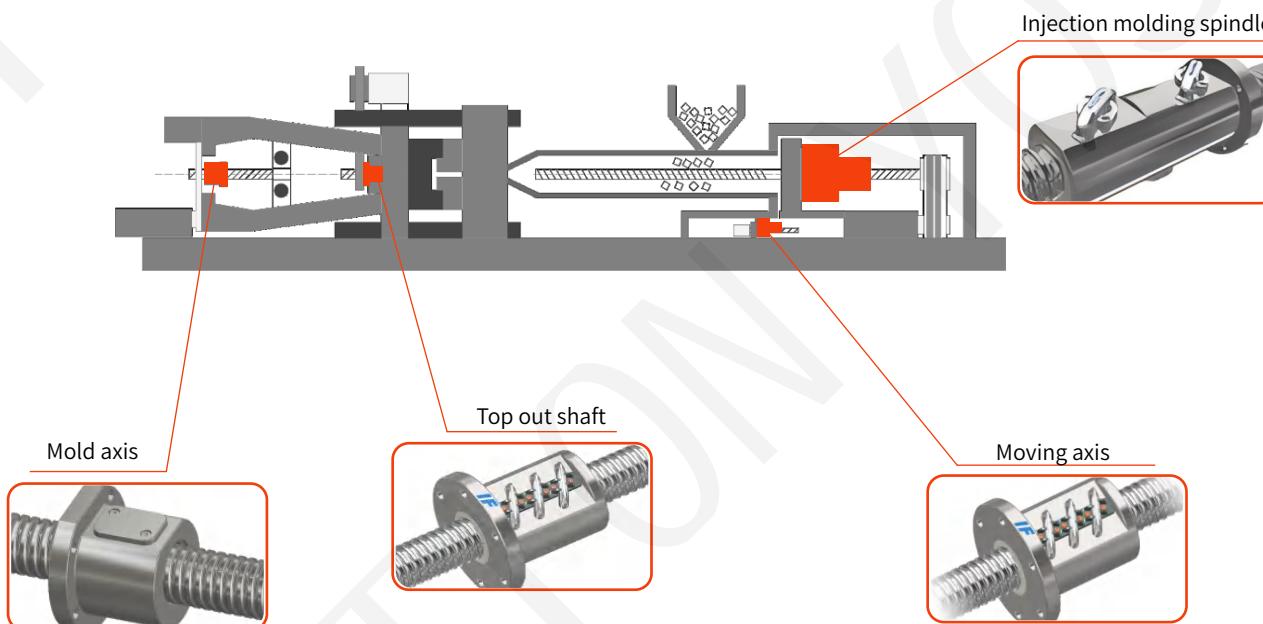

Downward spindle

**02**

Servo pressure machine

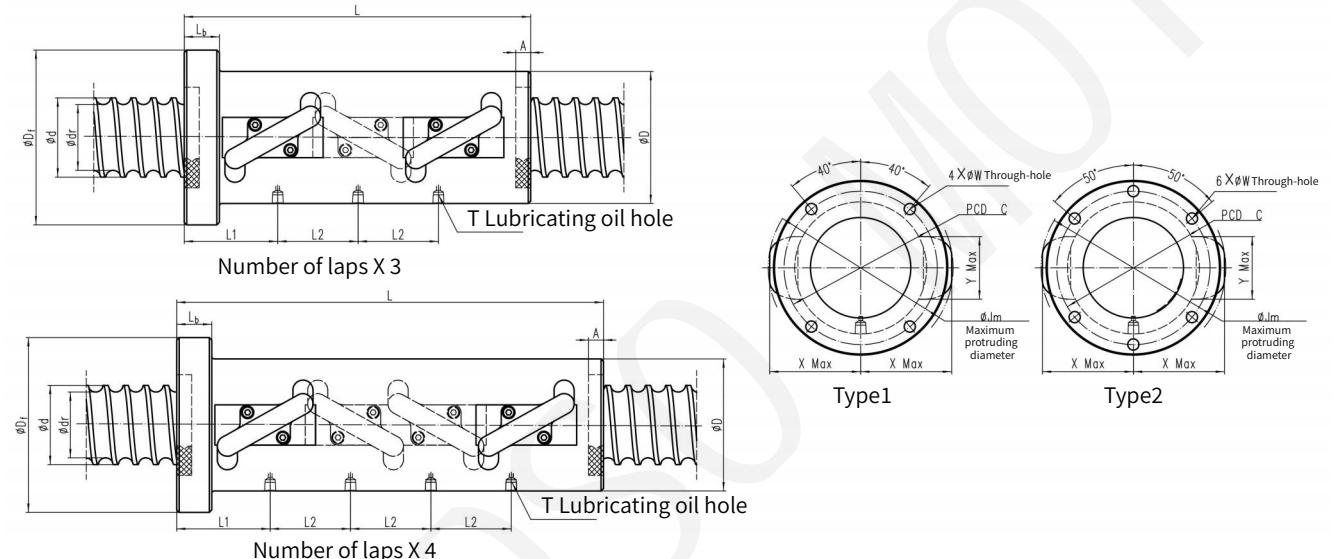

Selection suggestion:  
Select ordinary heavy-duty or SRCS steel ball circulation system heavy-duty ball screw pair according to actual accuracy requirements

# YOSO MOTION BALL SCREW

## HTF-SRC series Heavy duty ball screw

### ■ Product Selection Table

The table provides detailed technical specifications for YOSO heavy-duty ball screws. It includes columns for model, nominal diameter, lead, ball diameter, screw shaft bottom diameter, effective number of laps, basic rated load (kN), nut size, dimensions of the protruding part of the recycler, lubricating oil hole, and location of lubricating oil hole.

Specifications model	nominal diameter d	Lead the way P	Ball diameter dr	Screw shaft bottom diameter r	Effective number of laps Number of turns X number of columns	Basic rated load(kN)	Nut size													
							Rated dynamic load Ca	E Dinging load Coa	Nut length L	Nut external diameter D	Flange plate external diameter Df	Flange plate width Lb	seal ring size	Bolt hole Node size PCD	Bolt hole size C	Dimensions of the protruding part of the recycler	Lubricati ng oil hole T	Location of lubricating oil hole L1	Location of lubricating oil hole L2

Note:

1. The circulators in this table are arranged on both sides. If single-sided arrangement is required, please contact YOSO
2. This table is the selection table for YOSO heavy-duty ball screws. For more product types, please call us for consultation.

### Example of Ball Nut Selection

### Selection instructions:

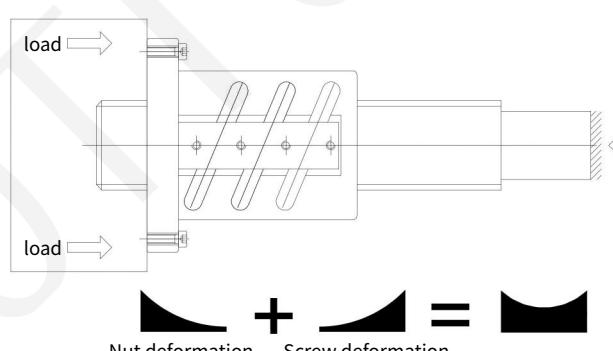

1. The HTF-SRC (S) table in the specification and model table can choose between two types of screw types: HTF-SRC or HTF-SRCS. The HTF-SRCS table only has
- This type of screw flange has two types to choose from: Type I and Type II.
- The maximum operating temperature should not exceed 72 °C, and good lubrication should be ensured during use.
- The right-handed screw is the YOSO standard screw. If you need a left-handed screw, please call for more information.
- When selecting products without sealing rings, the actual total screw diameter is L-A.

### ■ Selection of accuracy level and axial clearance

Select the appropriate precision level and axial clearance based on the maximum transmission speed. Generally, the higher the precision level, the greater the axial clearance, and the faster the transmission speed.

Ball screw pair type	Accuracy level	Axial clearance
SRC series and ordinary heavy-duty	T2,T3,T4,T5,T7,T10	X: 0~0.005mm,Z: 0~0.02mm,D: 0~0.05mm
SRCS series heavy-duty	T1,T2,T3,T4,T5	0 <sup>①</sup> ,X: 0~0.005mm,Z: 0~0.02mm,D: 0~0.05mm

① The SRCS cycle system ball screw pair can apply a small preload force, with zero axial clearance, achieving more precise transmission.

### ■ Determination of rated dynamic load

Calculate the rated dynamic load based on the expected working time  $L_h$  (hours) of the ball screw pair

$$C_a = \frac{F_m f_w}{100 f_a f_c} \times \sqrt[3]{60 L_h n_m}$$

In the formula:

$F_m$ : Average axial load (N)

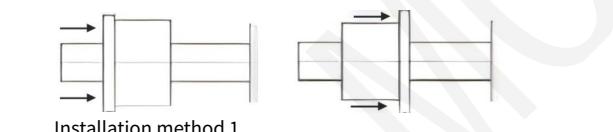

$L_h$ : Expected working time (hours)

$n_m$ : Average speed (r/min)

$f_a$ : Accuracy coefficient

$f_c$ : Reliability coefficient

$f_w$ : Load property coefficient

The rated dynamic load  $C_a$  refers to the constant load that the ball screw pair steel ball can theoretically withstand in the raceway treatment under the condition of a rated life of  $10^6$  revolutions.

Note:

The flange thread installation holes in this sample book are set assuming the use of installation method I; When using installation method II, it is necessary to redesign the threaded installation holes and calculate the bolt strength requirements. Regardless of the installation method used, it is necessary to verify the strength of the ball screw flange, especially when using installation method II, to avoid flange fracture caused by stress concentration!

Note 1:

In general,  $f_c$  is taken as 1 (requiring a set of identical ball screw pairs to have a service life exceeding 90% of the desired life under the same conditions)

## YOZO German quality, Industrie 4.0 best platform

High speed

Heavy load

Precise

Focusing on the research and production of high-speed heavy-duty precision ball screws
